Introduce JSON Input Interfaces for UOM and UOM Literals

To streamline Unit of Measure (UOM) data creation and simplify automation, we are introducing **UOM** and **UOM Literals** Input Interfaces in **JSON** format. You can utilize these input interfaces to create UOMs and associated UOM Literals via APIs.

Key Details

- **Format Support:** Both interfaces are supported only in JSON format.
- **Permissions:** Users (excluding Admin and Management roles) must have the "lgfapi / lgfapi Create Access" group permission to utilize these APIs.

UOM Input Interface

Use this interface to create new UOMs.

API URL:

```
POST .../wms/lgfapi/v10/stage/uom
```

The API processes entries with "`base_uom_flg` = "`true`" (base UOMs) first, followed by entries with "`base_uom_flg` = "`false`" (non-base UOMs).

UOM Literals Input Interface

Use this interface to create localized terminology (literals) for existing UOMs. It supports multiple languages (e.g., English, Chinese, Spanish, French, Korean).

API URL:

```
POST .../wms/lgfapi/v10/stage/uom_terminology
```

Note: For detailed API documentation and sample payloads, refer to the WMS REST API Guide.
