Display Additional Item Property during Mobile Transactions

You can now display additional item properties during **Receive Single SKU** and **Sort and Receive** mobile transactions. This enhancement provides additional information to identify scanned item.

This helps you with the following:

- Speeds up item identification during receiving.
- Reduces reliance on primary item codes.
- Improves accuracy in high-volume operations.

New Screen Parameter

We have introduced a new selection type screen parameter “extra-item-property-disp” to the **Receive Single SKU** and **Sort and Receive** mobile transactions. Use this parameter to configure the item property to display.

Parameter Behavior and Choices

The following table details the screen parameter behavior:

Screen Parameter Choice	**Behavior**
None or Blank	Default: The system does not display additional item property.
Item Code	When an item is scanned, the system displays the selected item property.
Item Alternate Code	
Item Part A	
Item External Style	
Item Description	
Item Facility Description	
Item Short Description	
Item Description 2	
Season Code	
Item Description 3	
Item Barcode	

Important Considerations

- **Transaction Support:** The screen parameter value “Item Description” is not supported for the **Sort and Receive** transaction.
- **Missing Configuration:** If an item is not configured with the selected item property, the system does not display the additional property.
- **Fallback Logic:** If “Item Facility Description” is blank for an item, the system displays the respective item description instead.
